

Transforming the German Building Sector: Targets, Policy Framework and Challenges

Research-policy workshop on heat decarbonisation 14 October 2019, Edinburgh

Dr. Veit Bürger, Öko-Institut e.V.

Our Profile

Öko-Institut is a leading European research and consultancy institute working for a sustainable future.

- A non-profit association founded in 1977
- Offices in Freiburg, Darmstadt and Berlin
- More than 170 staff
- Clients: European Union, national and state-level ministries, companies, foundations and non-governmental organizations

Where do we currently stand?

Final energy demand of the building sector not sufficiently decreasing

Where do we currently stand?

RES share in HC sector stagnating...

 \dots so do the sector's CO₂ emissions

Source: Öko-Institut (2019)

What are the targets?

THG-emissions of the building sector (domestic + non-domestic)

Source: Öko-Institut (2019)

The latest policy developments

...resulting from a failure to meet our 2020 targets and public pressure (school strikes)

Amongst others

- Introduction of CO₂-pricing for non-ETS sectors
- Tax incentives for refurbishment measures
- Improving the support conditions and available support budgets of existing programs (efficiency measures + RES)
- Specific support for prefabrication/industrialised retrofits (Energiesprong concept)
- As of 2026 ban of new monovalent oil boilers *"if a climate-friendly alternative is available"*

How do our heating systems look like today?

Final energy mix for heating + ...and how it could/should look domestic warm water, domestic buildings

like in 2050

What are the main challenges with regard to the transformation of our heat supply? – Example 1

Densely populated areas (city centres) with

- limited potential for deep retrofits (protected facades etc.)
- limited on-site potentials for decentralized RES

...will depend on energy supply from outside of the city

- DH -> produced by RES-H and RES-E
- Electricity -> produced by RES-E
- Gas -> PtG produced by RES-E

Challenges:

- development of the infrastructures (DH)
- providing sufficient areas close to the cities for RES production
- public acceptance

Öko-Institut e.V.

What are the main challenges with regard to the transformation of our heat supply? – Example 2

Typical un-refurbished single and double family houses in rural areas

- Often gas grid not available
- Heat pumps lacking efficiency due to high temperature levels in the internal distribution system
 - -> requires retrofit of the buildings first
- Biomass: limited resource that should better be used in other sectors
- DH: Energy density often too low

Moreover

 Nearly one third of owners of older houses is over 65 years old

Öko-Institut e.V.

The future role of natural gas in heating our buildings

- In a Paris compatible world no room for natural gas in the building sector
- Substitution of heating oil by natural gas only an interim solution for the next 5-10 years (otherwise lock-in)
- No or only very limited role of PtG in the building sector
 - Limited national RES-E potential
 - High losses in PtG-production
 - High production costs
 - Long lead time until large market volume can be covered
- Necessary: Start to develop deinvestment-strategies for gas distribution grid

Thank you for your attention!

Do you have any questions?
